

4. Desktop Computer Components and Repair

Bands and clips to connect hand and mat to the ground to prevent electro static discharge to the components of the computer and cause any damage

Ground yourself by touching the case of the computer before installing cpu, cleaning and reapplying thermal paste, screwing in the heat sink fan, handling the cpu

Match the speed, company, size of all the RAM sticks

DDR: Double Data Rate

SDRAM: Synchronous Dynamic Random Access Memory

Ram putting order on the UDIMM slots must match manual of the motherboard

Installing storage disks, make sure the size of the disks is compatible with the case

turn the psu power switch on before trying to boot the computer

while installing gpu, make sure to check if the psu has enough power to give it to the gpu

taking the motherboard out: unplug cables, take out gpu, rams, unscrew mounting screws. name the wires using tape and marker, make sure to line up the cable heads properly before plugging the wires in, clr cmos clears the bios settings and resets to defaults

dvi, vga, usb c, b, a, a 3.0, adapters, hdmi, display port, rj45, 3.5 mm jack, ps/2 for old keyboard and mouse

power on self test: POST, bios navigation is with keyboard.

Ticket Interrupt:

Steps I would take:

1. Check if the PSU was on, inspect if there are any damages (t).
2. Check the power cords, video cables.
3. Check if the multiplug is on or not and working properly or not by testing other devices. (T)
4. Try unplugging them and replugging them. if that doesn't work, consult manual to verify the power ON pins and try to manually jumper them. (T)
5. Check if the breaker to the outlet tripped.
6. Check if the monitor was turned on.
7. Check if the display cable was connected properly on both ends.

8. Check if the wires from the power supply was connected properly to the motherboard.
9. Check if the fan was connected to power on the motherboard.
10. Reset the CMOS by unplugging the battery or with the jumpers. (T)
11. Replace the PSU, test the Motherboard or replace it. (T)

The steps should go from simplest, fastest and easiest to do to complex and drastic.
